

Laboratory Exercise 5

Using Interrupts with Assembly Code

The purpose of this exercise is to investigate the use of interrupts for the ARM A9 processor, using assembly-language code. To do this exercise you need to be familiar with the exceptions processing mechanisms for the ARM A9 processor, and with the operation of the ARM Generic Interrupt Controller (GIC). These concepts are discussed in the tutorials *Introduction to the ARM Processor*, and *Using the ARM Generic Interrupt Controller*. You should also read the parts of the DE1-SoC Computer documentation that pertain to the use of exceptions and interrupts.

Part I

Consider the main program shown in Figure 1. The code first sets the exceptions vector table for the ARM processor using a code section called *.vectors*. Then, in the *.text* section the main program needs to set up the stack pointers (for both interrupt mode and supervisor mode), initialize the generic interrupt controller (GIC), configure the pushbutton KEYs port to generate interrupts, and finally enable interrupts in the processor. You are to fill in the code that is not shown in the figure.

The function of your program is to show the numbers **0** to **3** on the *HEX0* to *HEX3* displays, respectively, when a corresponding pushbutton *KEY* is pressed. Since the main program simply “idles” in an endless loop, as shown in Figure 1, you have to control the displays by using an interrupt service routine for the pushbutton KEYs port.

Perform the following:

1. Create a new folder to hold your Monitor Program project for this part. Create a file, such as *part1.s*, and type the assembly language code for the main program into this file.
2. Create any other source code files you may want, and write the code for the *CONFIG_GIC* subroutine that initializes the GIC. Set up the GIC to send interrupts to the ARM processor from the pushbutton KEYs port.
3. The bottom part of Figure 1 gives the code required for the interrupt handler, *SERVICE_IRQ*. You have to write the code for the *KEY_ISR* interrupt service routine. Your code should show the digit **0** on the *HEX0* display when *KEY₀* is pressed, and then if *KEY₀* is pressed again the display should be “blank”. You should toggle the *HEX0* display between **0** and “blank” in this manner each time *KEY₀* is pressed. Similarly, toggle between “blank” and **1**, **2**, or **3** on the *HEX1* to *HEX3* displays each time *KEY₁*, *KEY₂*, or *KEY₃* is pressed, respectively.

Figure 2 provides code, using just simple loops, which can be used for the other ARM exception handlers.

4. Make a new Monitor Program project in the folder where you stored your source-code files. In the Monitor Program screen illustrated in Figure 3, make sure to choose **Exceptions** in the *Linker Section*

Presets drop-down menu. Compile, download, and test your program.

```

Figure 3: Selecting the Exceptions linker section.

Part II

Consider the main program shown in Figure 4. The code is required to set up the ARM A9 stack pointers for interrupt and supervisor modes, and then enable interrupts. The subroutine *CONFIG_GIC* configures the GIC to send interrupts to the ARM processor from two sources: HPS Timer 0, and the pushbutton KEYs port. The main program calls the subroutines *CONFIG_HPS_TIMER* and *CONFIG_KEYS* to set up the two ports. You are to write each of these subroutines. Set up HPS Timer 0 to generate one interrupt every 0.25 seconds.

In Figure 4 the main program executes an endless loop writing the value of the global variable *COUNT* to the red lights LEDR. In the interrupt service routine for HPS Timer 0 you are to increment the variable *COUNT* by the value of the *RUN* global variable, which should be either 1 or 0. You are to toggle the value of the *RUN* global variable in the interrupt service routine for the pushbutton KEYs, each time a KEY is pressed. When *RUN* = 0, the main program will display a static count on the red lights, and when *RUN* = 1, the count shown on the red lights will increment every 0.25 seconds.

Make a new Monitor Program project for this part, and assemble, download, and test your code.

Part III

Modify your program from Part II so that you can vary the speed at which the counter displayed on the red lights is incremented. All of your changes for this part should be made in the interrupt service routine for the pushbutton KEYs. The main program and the rest of your code should not be changed.

Implement the following behavior. When *KEY*₀ is pressed, the value of the *RUN* variable should be toggled, as in Part I. Hence, pressing *KEY*₀ stops/runs the incrementing of the *COUNT* variable. When *KEY*₁ is pressed, the rate at which *COUNT* is incremented should be doubled, and when *KEY*₂ is pressed the rate should be halved. You should implement this feature by stopping HPS Timer 0 within the pushbutton KEYs interrupt service routine, modifying the load value used in the timer, and then restarting the timer.

Part IV

For this part you are to add a third source of interrupts to your program, using the A9 Private Timer. Set up the timer to provide an interrupt every 1/100 of a second. Use this timer to increment a global variable called *TIME*. You should use the *TIME* variable as a real-time clock that is shown on the seven-segment displays *HEX3* – 0. Use the format *SS:DD*, where *SS* are seconds and *DD* are hundredths of a second. You should be able to stop/run the clock by pressing pushbutton *KEY*₃. When the clock reaches *59:99*, it should wrap around to *00:00*.

Make a new folder to hold your Monitor Program project for this part. Modify the main program from Part III to call a new subroutine, named *CONFIG_PRIV_TIMER*, which sets up the A9 Private Timer to generate the required interrupts. To show the *TIME* variable in the real-time clock format *SS:DD*, you can use the same approach that was followed for Part 4 of Lab Exercise 4. In that previous exercise you used polled I/O with the private timer, whereas now you are using interrupts. One possible way to structure your code is illustrated in Figure 5. In this version of the code, the endless loop in the main program writes the value of a variable named *HEX_code* to the *HEX3* – 0 displays.

```

        .section    .vectors, "ax"
        ... code not shown

        .text
        .global    _start

_start:
/* Set up stack pointers for IRQ and SVC processor modes */
        ... code not shown

        BL        CONFIG_GIC           // configure the ARM generic interrupt controller
        BL        CONFIG_HPS_TIMER     // configure HPS Timer 0
        BL        CONFIG_KEYS          // configure the pushbutton KEYS port

// Enable IRQ interrupts in the ARM processor
        ... code not shown
        LDR        R5, =0xFF200000     // LEDR base address
LOOP:
        LDR        R3, COUNT           // global variable
        STR        R3, [R5]           // light up the red lights
        B          LOOP

/* Configure the HPS timer to create interrupts at 0.25 second intervals */
CONFIG_HPS_TIMER:
        ... code not shown
        BX        LR

/* Configure the pushbutton KEYS to generate interrupts */
CONFIG_KEYS:
        ... code not shown
        BX        LR

/* Global variables */
        .global    COUNT
COUNT:  .word     0x0                 // used by timer
        .global    RUN
RUN:     .word     0x1                 // initial value to increment COUNT

        .end

```

Figure 4: Main program for Part II.

Using the scheme in Figure 5, the interrupt service routine for the private timer has to increment the *TIME* variable, and also update the *HEX_code* variable that is being written to the 7-segment displays by the main program.

Make a new Monitor Program project and test your program.

```

        .text
        .global    _start

_start:
/* Set up stack pointers for IRQ and SVC processor modes */
    ... code not shown
    BL        CONFIG_GIC            // configure the ARM generic interrupt controller
    BL        CONFIG_PRIV_TIMER     // configure the private timer
    BL        CONFIG_HPS_TIMER      // configure HPS Timer 0
    BL        CONFIG_KEYS           // configure the pushbutton KEYs port
/* Enable IRQ interrupts in the ARM processor */
    ... code not shown
    LDR        R5, =0xFF200000       // LEDR base address
    LDR        R6, =0xFF200020       // HEX3-0 base address
LOOP:
    LDR        R4, COUNT              // global variable
    STR        R4, [R5]               // light up the red lights
    LDR        R4, HEX_code           // global variable
    STR        R4, [R6]               // show the time in format SS:DD
    B          LOOP

/* Configure the MPCore private timer to create interrupts every 1/100 seconds */
CONFIG_PRIV_TIMER:
